Question 1

TCP Header

Source F	Port	destination Port			
	Sequence	e number			
Data Offset	Reserved	Flags	Window		
Checksi	um	Urgent Pointer			
Data					

```
V Internet Protocol Version 4, Src: 192.168.1.3, Dst: 104.47.28.22
    0100 .... = Version: 4
    .... 0101 = Header Length: 20 bytes (5)

> Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
    Total Length: 1492
    Identification: 0xafbf (44991)

> Flags: 0x4000, Don't fragment
    Fragment offset: 0
    Time to live: 128
    Protocol: TCP (6)
    Header checksum: 0xff73 [validation disabled]
    [Header checksum status: Unverified]
    Source: 192.168.1.3
    Destination: 104.47.28.22

> Transmission Control Protocol, Src Port: 56117, Dst Port: 443, Seq: 3236, Ack: 11517, Len: 1452
```

TCP Packet Captured with header above

Source Ip Address: 192.168.1.3 the address of the host that sent the packet.

Destination Ip Address: 104.47.28.22 the address of the receiver.

Version 4 is the ip protocol version.

Header length is the length of the header 20 out of 60 max bytes. Total length is the total length of the packet including the header of 20 bytes. Identification describes the packet, flag controls the fragmentation and it doesn't fragment here. The fragment offset describes if the packet is too big to take apart and put together here it's not.

Time to live describes the length of time it has to send and discards if longer than the TTL. TTL is 128

Protocol is the type the packet is and this is a TCP.

Header checksum checks the headers checksum and its unverified.

Question 2

UDP Pseudo Header

	32-bit source	e IP Address	
	32-bit destina	tion IP Address	S
zero	8-bit proto	ocol (17) 16-bit UDP leng	
16-bit source po	ort number	16-bit de	stination port number
16-bit UDP	length	16-bit UDP checksum	
	D	ata	

```
Internet Protocol Version 4, Src: 192.168.1.3, Dst: 74.125.193.101
     0100 .... = Version: 4
     .... 0101 = Header Length: 20 bytes (5)
   > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
     Total Length: 61
     Identification: 0x0ab1 (2737)
   > Flags: 0x4000, Don't fragment
     Fragment offset: 0
     Time to live: 128
     Protocol: UDP (17)
     Header checksum: 0x2271 [validation disabled]
     [Header checksum status: Unverified]
     Source: 192.168.1.3
     Destination: 74.125.193.101
> User Datagram Protocol, Src Port: 50896, Dst Port: 443
> Data (33 bytes)
```

UDP Packet Captured with header above

Source Ip Address: 192.168.1.3 the address of the host that sent the packet.

Destination Ip Address: 74.125.193.101 the address of the receiver.

Version 4 is the ip protocol version.

Header length is the length of the header 20 out of 60 max bytes. Total length is the total length of the packet including the header of 20 bytes.

Identification describes the packet, flag controls the fragmentation and it doesn't fragment here. The fragment offset describes if the packet is too big to take apart and put together here it's not.

Time to live describes the length of time it has to send and discards if longer than the TTL. In this case 128

Protocol is the type the packet is and this is a UDP.

Header checksum checks the headers checksum and its unverified.

Question 3

	192.168.1.3	74.125.193.101	UDP	75 50896 → 443 L	en=33
455 88.866133	74.125.193.101	192.168.1.3	UDP	106 443 → 50896 L	en=64

Question 4

- 1	158 0.040104	185.42.206.97	192.168.1.3	TLSv1.2	1506 Application Data [TCP segment of a reassembled PDU]
	159 0.040104	185.42.206.97	192.168.1.3	TCP	1506 443 → 65263 [ACK] Seq=181824 Ack=1354 Win=199 Len=1452 [TCP segment of a reassembled PDU]
	160 0.040104	185.42.206.97	192.168.1.3	TCP	1506 443 → 65263 [ACK] Seq=183276 Ack=1354 Win=199 Len=1452 [TCP segment of a reassembled PDU]
	161 0.040104	185.42.206.97	192.168.1.3	TCP	1506 443 → 65263 [ACK] Seq=184728 Ack=1354 Win=199 Len=1452 [TCP segment of a reassembled PDU]

The packet above uses the TCP. I'm not sure if this is a streaming packet but it came up a lot while I ran a stream on its own.

Question 5

39 0.954610	192.168.1.3	140.82.121.3	TCP	66 49295 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 WS=256 SACK PERM=1
43 0.986227	140.82.121.3	192.168.1.3	TCP	66 443 → 49295 [SYN, ACK] Seq=0 Ack=1 Win=65535 Len=0 MSS=1436 SACK_PERM=1 WS=1024
44 0.986280	192.168.1.3	140.82.121.3	TCP	54 49295 → 443 [ACK] Seq=1 Ack=1 Win=132096 Len=0

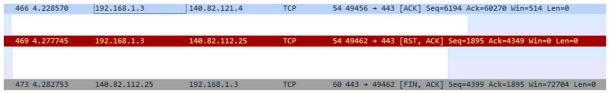

Segment with SYN sent to start a connection with server and the sequence number of it. Tells the server the client is about to communicate with it. Next will be the response from the server and this will be a SYN, ACK. These are the segment that was received and the sequence number.

The last part is the ACK and this establishes that a connection between the client and the server has occurred.

Question 6

431 4.173726	192.168.1.3	140.82.112.25	TCP	54 49462 → 443 [FIN, ACK] Seq=1894 Ack=4276 Win=131328 Len=0
--------------	-------------	---------------	-----	--

Client sends FIN, ACK to state that the client wants to end the connection with the server

The server sends back a ACK and then sends a FIN, ACK to the client to start the close of the connection.

```
564 4.701916 192.168.1.3 140.82.121.5 TCP 54 49443 + 443 [ACK] Seq=44513 Ack=3103 Win=512 Len=0
```

The final ACK is sent from the client to the server to make sure the connection has been closed

Bonus Question

What are the gateways in case of Tcp/ip?

(WisdomJobs.com, 2020) states its function is to provide connectivity between network segments and runs on a computer and is a type of software. It provides a translation and allows systems to communicate on a network.

What is a link in the case of Tcp/ip?

(WisdomJobs.com, 2020) states that this is how two devices are communicating together and include protocols and the cables used and its describes the connectivity between the two devices.
